

Functions and Function Expressions

Task 1.

- Write a function that sums an array of numbers:
 - Numbers must be always of type `Number`
 - Returns `null` if the array is empty
 - Throws Error if the parameter is not passed (undefined)
 - Throws if any of the elements is not convertible to `Number`

Task 2.

- Write a function that finds all the prime numbers in a range
 - It should return the prime numbers in an array
 - It must throw an Error if any of the range params is not convertible to `Number`
 - It must throw an Error if any of the range params is missing
